

Finetuning Analysis Report

1. Introduction

This report provides an in-depth analysis of the finetuning job and an dataset analysis. Using the finetuned model and the dataset, we generated text embeddings and applied various techniques to visualize and interpret the data. The analysis includes t-SNE visualization, UMAP projection with KMeans clustering, anomaly detection, and topic identification using KMeans clustering. Additionally, we generated a word cloud to visualize the most frequent words in the dataset. The report aims to provide insights into the underlying structure of the text data and identify potential outliers or anomalies. The following sections present the results of the analysis along with visualizations and interpretations.

2A. Training and Validation Loss Improvements

The table below shows the percentage improvement in training and validation losses over the course of training.

Loss Improvement Metrics

Metric	Value
Train Loss Improvement	65.28%
Validation Loss Improvement	21.02%

2B. Training Loss Over Steps

The learning curve has not plateaued, indicating that the model was still making progress in learning from the training data. The percentage change in training loss over the last 5 steps is approximately -8.94%, suggesting that further training could potentially lead to improvements.

Overall a percentage difference of 65.28% in the training loss was observed. The training loss plot is crucial for understanding the model's learning progress over time. A downward trend in the loss indicates that the model is learning and improving its predictions. If the last few evaluation losses are relatively constant, it suggests that the model's learning has plateaued, indicating that the model may have reached its learning capacity on the given dataset. However, if the evaluation loss continues to decrease, even subtly, it could mean that the model may benefit from additional training epochs, as there's potential for further convergence. In practice, a balance must be struck to avoid overfitting, where the model learns the training data too well, including its noise and outliers, which can harm generalization to new data.

Training and Evaluation Loss over Steps

3. Word Cloud of Text Data

Word Cloud of All Texts

The word cloud visualization provides a quick and intuitive way to understand the most prominent terms and themes present in the dataset. The size of each word in the cloud corresponds to its frequency across the text corpus; larger words indicate higher frequency. Such a visualization allows us to gauge the focus and recurring topics in the dataset at a glance.

In reviewing this word cloud, notice which terms are most dominant. These terms often give insight into the overarching subject matter or discourse within the data. It's also useful for identifying any unexpected or unusual words that may warrant further investigation. In some cases, a word cloud can reveal biases, commonalities, or trends that might not be immediately evident from a cursory reading of the texts.

4. UMAP with KMeans Clustering

UMAP, combined with KMeans clustering, identifies distinct topics or themes within the data. Each color in the plot represents a different cluster, suggesting groupings of texts with similar content.

6. Anomaly Scores Distribution

This histogram shows the distribution of anomaly scores given by the Isolation Forest method, this method is used to identify the severity of anomalies in the dataset. Anomalies are data points that significantly differ from the norm, potentially indicating errors or unique patterns. If the distribution is skewed to the right, it indicates a higher number of anomalies. If the distribution is uniform, it indicates a lower number of anomalies.

5. Outliers Detection

Outliers detection is a critical step in data analysis, especially when dealing with large text datasets. Outliers can significantly influence the outcomes of statistical analyses and predictive modeling, leading to skewed results. In this context, outliers are unusual or atypical texts that deviate markedly from the majority of the data. Identifying these outliers helps in understanding the data's underlying structure and possibly uncovering rare but insightful patterns or anomalies that could be of interest. For this analysis we used the Isolation Forest algorithm, a SOTA anomaly detection technique, to compute anomaly scores for each text. These were then applied to systematically identify outliers. This method excels in detecting data points that diverge from the norm, highlighting texts that exhibit unique characteristics compared to the typical patterns observed in the dataset. The following texts are identified as outliers:

1. Below is an instruction that describes a task. Write a response that appropriately completes the request.

###Instruction:</s>John goes to the bakery to buy rolls. They sell them for 5 dollars for a dozen. He spent 15 dollars. How many rolls did he get?</s>

###Response:</s>He got $15/5=3$ dozen rolls.

1. Below is an instruction that describes a task. Write a response that appropriately completes the request.
 ###Instruction:</s>Hasan is packing up his apartment because hes moving across the country for a new job. He needs to ship several boxes to his new home. The movers have asked that Hasan avo...

2. Below is an instruction that describes a task. Write a response that appropriately completes the request.

###Instruction:</s>Palmer loves taking photos and has an album of 100 photos under her bed to mark memories of places she's been. She recently went on a long trip to Bali. Palmer took 50 new...

3. Below is an instruction that describes a task. Write a response that appropriately completes the request.

###Instruction:</s>James has 5 dozen boxes of matches. Each box contains 20 matches. How many matches does James have?</s>

###Response:</s>He has $5 \times 12 = 60$ boxes of matches
 That...

4. Below is an instruction that describes a task. Write a response that appropriately completes the request.

###Instruction:</s>James collects all the fruits from his 2 trees. Each tree has 20 plants. Each plant has 1 seed and he plants 60% of those. How many trees did he plant?</s>

###Respons...

5. Below is an instruction that describes a task. Write a response that appropriately completes the request.

###Instruction:</s>In a car racing competition, Skye drove a 6-kilometer track. For the first 3 kilometers, his speed was 150 kilometers per hour. For the next 2 kilometers, his speed was 50...

6. Below is an instruction that describes a task. Write a response that appropriately completes the request.

###Instruction:</s>Peggy is moving and is looking to get rid of her record collection. Sammy says that he will buy all of them for 4 dollars each. Bryan is only interested in half of the rec...

7. Below is an instruction that describes a task. Write a response that appropriately completes the request.

###Instruction:</s>John buys 5 toys that each cost \$3. He gets a 20% discount. How much did he pay for everything?</s>

###Response:</s>The toys cost $5 \times 3 = 15$ His
 discount is wor...
